

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

LISTING OF CLAIMS:

Please cancel claims 1-64 found on pages 206-217 of the application.

Please amend the claims submitted in the preliminary amendment as follows:

65 2. (currently amended) A compiler, disposed on a computer readable medium, the compiler including instructions to cause a first processor to: access source code expressed in a computer language having an instruction set that includes:

an instruction set statement to declare a network protocol, the statement having a syntax to name packet data at one or more specified locations within a network packet; and

an instruction set statement to specify a rule, the rule having a syntax comprising a Boolean expression and at least one action to perform if the Boolean expression is true; and

based on the received source code, output instructions to cause a second processor to process received network packets by:

assigning value(s) to the named packet data based on data within a network packet in accordance with the instruction set statement to declare a network protocol; and

applying at least one rule in accordance with the instruction set statement to specify a rule.

66 3. (currently amended) The compiler of claim 65 2, wherein the source code comprises multiple instruction set statements to specify multiple rules and where the output instructions cause the second processor to apply the rules in an order corresponding to the order in which the rule statements to specify the multiple rules appear in the source code.

67 4. (currently amended) The compiler of claim 66 3, wherein the at least one action to perform of a rule statement returns a value controlling whether subsequent rules are applied to the packet.

68 5. (currently amended) The compiler of claim 65 2,
wherein the instruction set statement to declare a network protocol comprises a statement having a syntax comprising of:

protocol protocol_name { [field definitions(s)] }

and wherein the syntax to name packet data comprises field definitions having a syntax comprising of:

field_name {protocol_name [offset : field size] }.

69 6. (currently amended) The compiler of claim 65 2,
wherein the syntax of the instruction set statement to declare a network protocol further comprises at least one declaration of an encapsulated packet header associated with another network protocol; and
wherein the output instructions comprise instructions to name data of the encapsulated packet header.

70 7. (currently amended) The compiler of claim 69 6, wherein the at least one declaration of the encapsulated packet header comprises a declaration including an evaluation expression identifying whether the encapsulated packet header is present in a network packet.

71 8. (currently amended) The compiler of claim 70 7, wherein the declaration of the encapsulated packet header comprises a declaration having a syntax comprising of:

demux { Boolean_expression {protocol_name at offset} }

wherein the protocol_name identifies a protocol declared by an instruction statement to declare a network protocol.

72 9. (currently amended) The compiler of claim 65 2, wherein the instruction set includes:

an instruction set statement to name a set of values, the set of values comprising a set of tuples, wherein each tuple comprises one or more key values; and
an instruction set search statement to search the set of values.

73 10. (currently amended) The compiler of claim 72 9, wherein the instruction set search statement comprises a syntax of:

set_name.search_name(key(s)),

wherein the search_name is an expression that evaluates to true when at least one tuple of the set of values identified by the set_name matches the value(s) of the key(s) specified.

74 41. (currently amended) The compiler of claim 72 9, wherein the set of values are set by instructions external to the instructions output in response to the source code.

75 42. (currently amended) The compiler of claim 41, wherein the values are set based on the received network packets.

76 43. (currently amended) A method, comprising:
accessing source code expressed in a computer language having an instruction set that includes:

an instruction set statement to declare a network protocol, the statement having a syntax to name packet data at one or more specified locations within a network packet; and

an instruction set statement to specify a rule, the rule having a syntax comprising a Boolean expression and at least one action to perform if the Boolean expression is true; and

based on the received source code, outputting instructions to cause a processor to process received network packets by:

assigning value(s) to the named packet data based on data within a network packet in accordance with the instruction set statement to declare a network protocol; and

applying at least one rule in accordance with the instruction set statement to specify a rule.

77 44. (currently amended) The method of claim 76 43, wherein the source code comprises multiple instruction set statements to specify multiple rules and where the output instructions cause the second processor to apply the rules in an order corresponding to the order in which the rule statements to specify the multiple rules appear in the source code.

78 45. (currently amended) The method of claim 77 44, wherein the at least one action ~~to perform of a rule statement~~ returns a value controlling whether subsequent rules are applied to the packet.

79 46. (currently amended) The method of claim 76 43, wherein the instruction set statement to declare a network protocol comprises a statement having a syntax comprising of:

protocol protocol_name { [field definitions(s)] }

and wherein the syntax to name packet data comprises field definitions having a syntax comprising of:

field_name {protocol_name [offset : field size] }.

80 47. (currently amended) The method of claim 76 43, wherein the syntax of the instruction set statement to declare a network protocol further comprises at least one declaration of an encapsulated packet header associated with another network protocol; and

wherein the output instructions comprise instructions to name data of the encapsulated packet header.

81 48. (currently amended) The method of claim 80 47, wherein the at least one declaration of the encapsulated packet header comprises a declaration including an evaluation expression identifying whether the encapsulated packet header is present in a network packet.

82 19. (currently amended) The method of claim 81 18, wherein the declaration of the encapsulated packet header comprises a declaration having a syntax comprising of :

demux { Boolean_expression {protocol_name at offset} }

wherein the protocol_name identifies a protocol declared by an instruction statement to declare a network protocol.

83 20. (currently amended) The method of claim 76 13, wherein the instruction set includes:

an instruction set statement to name a set of values, the set of values comprising a set of tuples, wherein each tuple comprises one or more key values; and
an instruction set search statement to search the set of values.

84 21. (currently amended) The method of claim 83 20, wherein the instruction set search statement comprises a syntax of:

set_name.search_name(key(s)),

wherein the search_name is an expression that evaluates to true when at least one tuple of the set of values identified by the set_name matches the value(s) of the key(s) specified.

85 22. (currently amended) The method of claim 84 21, wherein the set of values are set by instructions external to the instructions output in response to the source code.
